

Fact Sheet

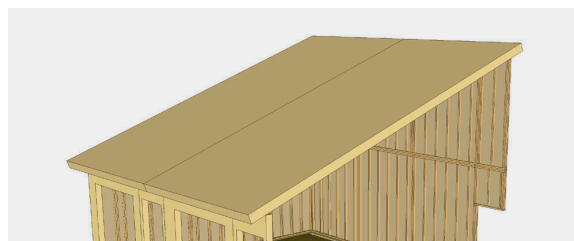

Roofs

Innovare's i-SIP building solutions offer a range of roofing options to precisely fit the specific needs of a project. The i-SIP roof options are quick to install, swift to be made watertight, and can incorporate any typical roof covering.

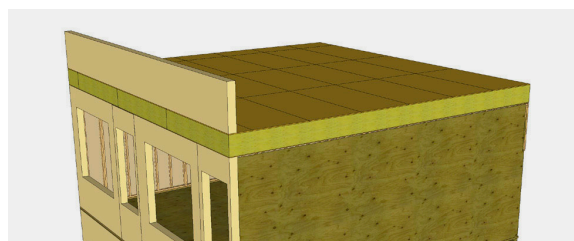

SIP roofs do not require support trusses, leaving clear, warm, habitable roof spaces.

Innovare's i-SIP engineered trussed rafters can be used to create a **pitched roof with a flat ceiling line**, ideal for creating a so-called 'cold roof', where insulation is laid between the rafters rather than on top of them, lowering the eventual roof height.

The i-SIP pre-insulated roof cassettes are ideal for producing **vaulted ceilings** or flat soffits with a suspended ceiling.

The i-SIP pre-insulated roof cassettes can easily be produced to a **nominal flat roof**. And with Innovare's Duck 2 finish, the roofs are insulated and weather resistant before they even reach the construction site, cutting down on delays and allowing for safer builds.

Innovare's Flask by i-SIP roofing solution delivers balanced thermal comfort along with the structural capability to give you unsupported spans of up to 12 metres.
